A working product

What happens

Establish Northstar as the sample project. Move from its complete page toward the area that needs a closer look.

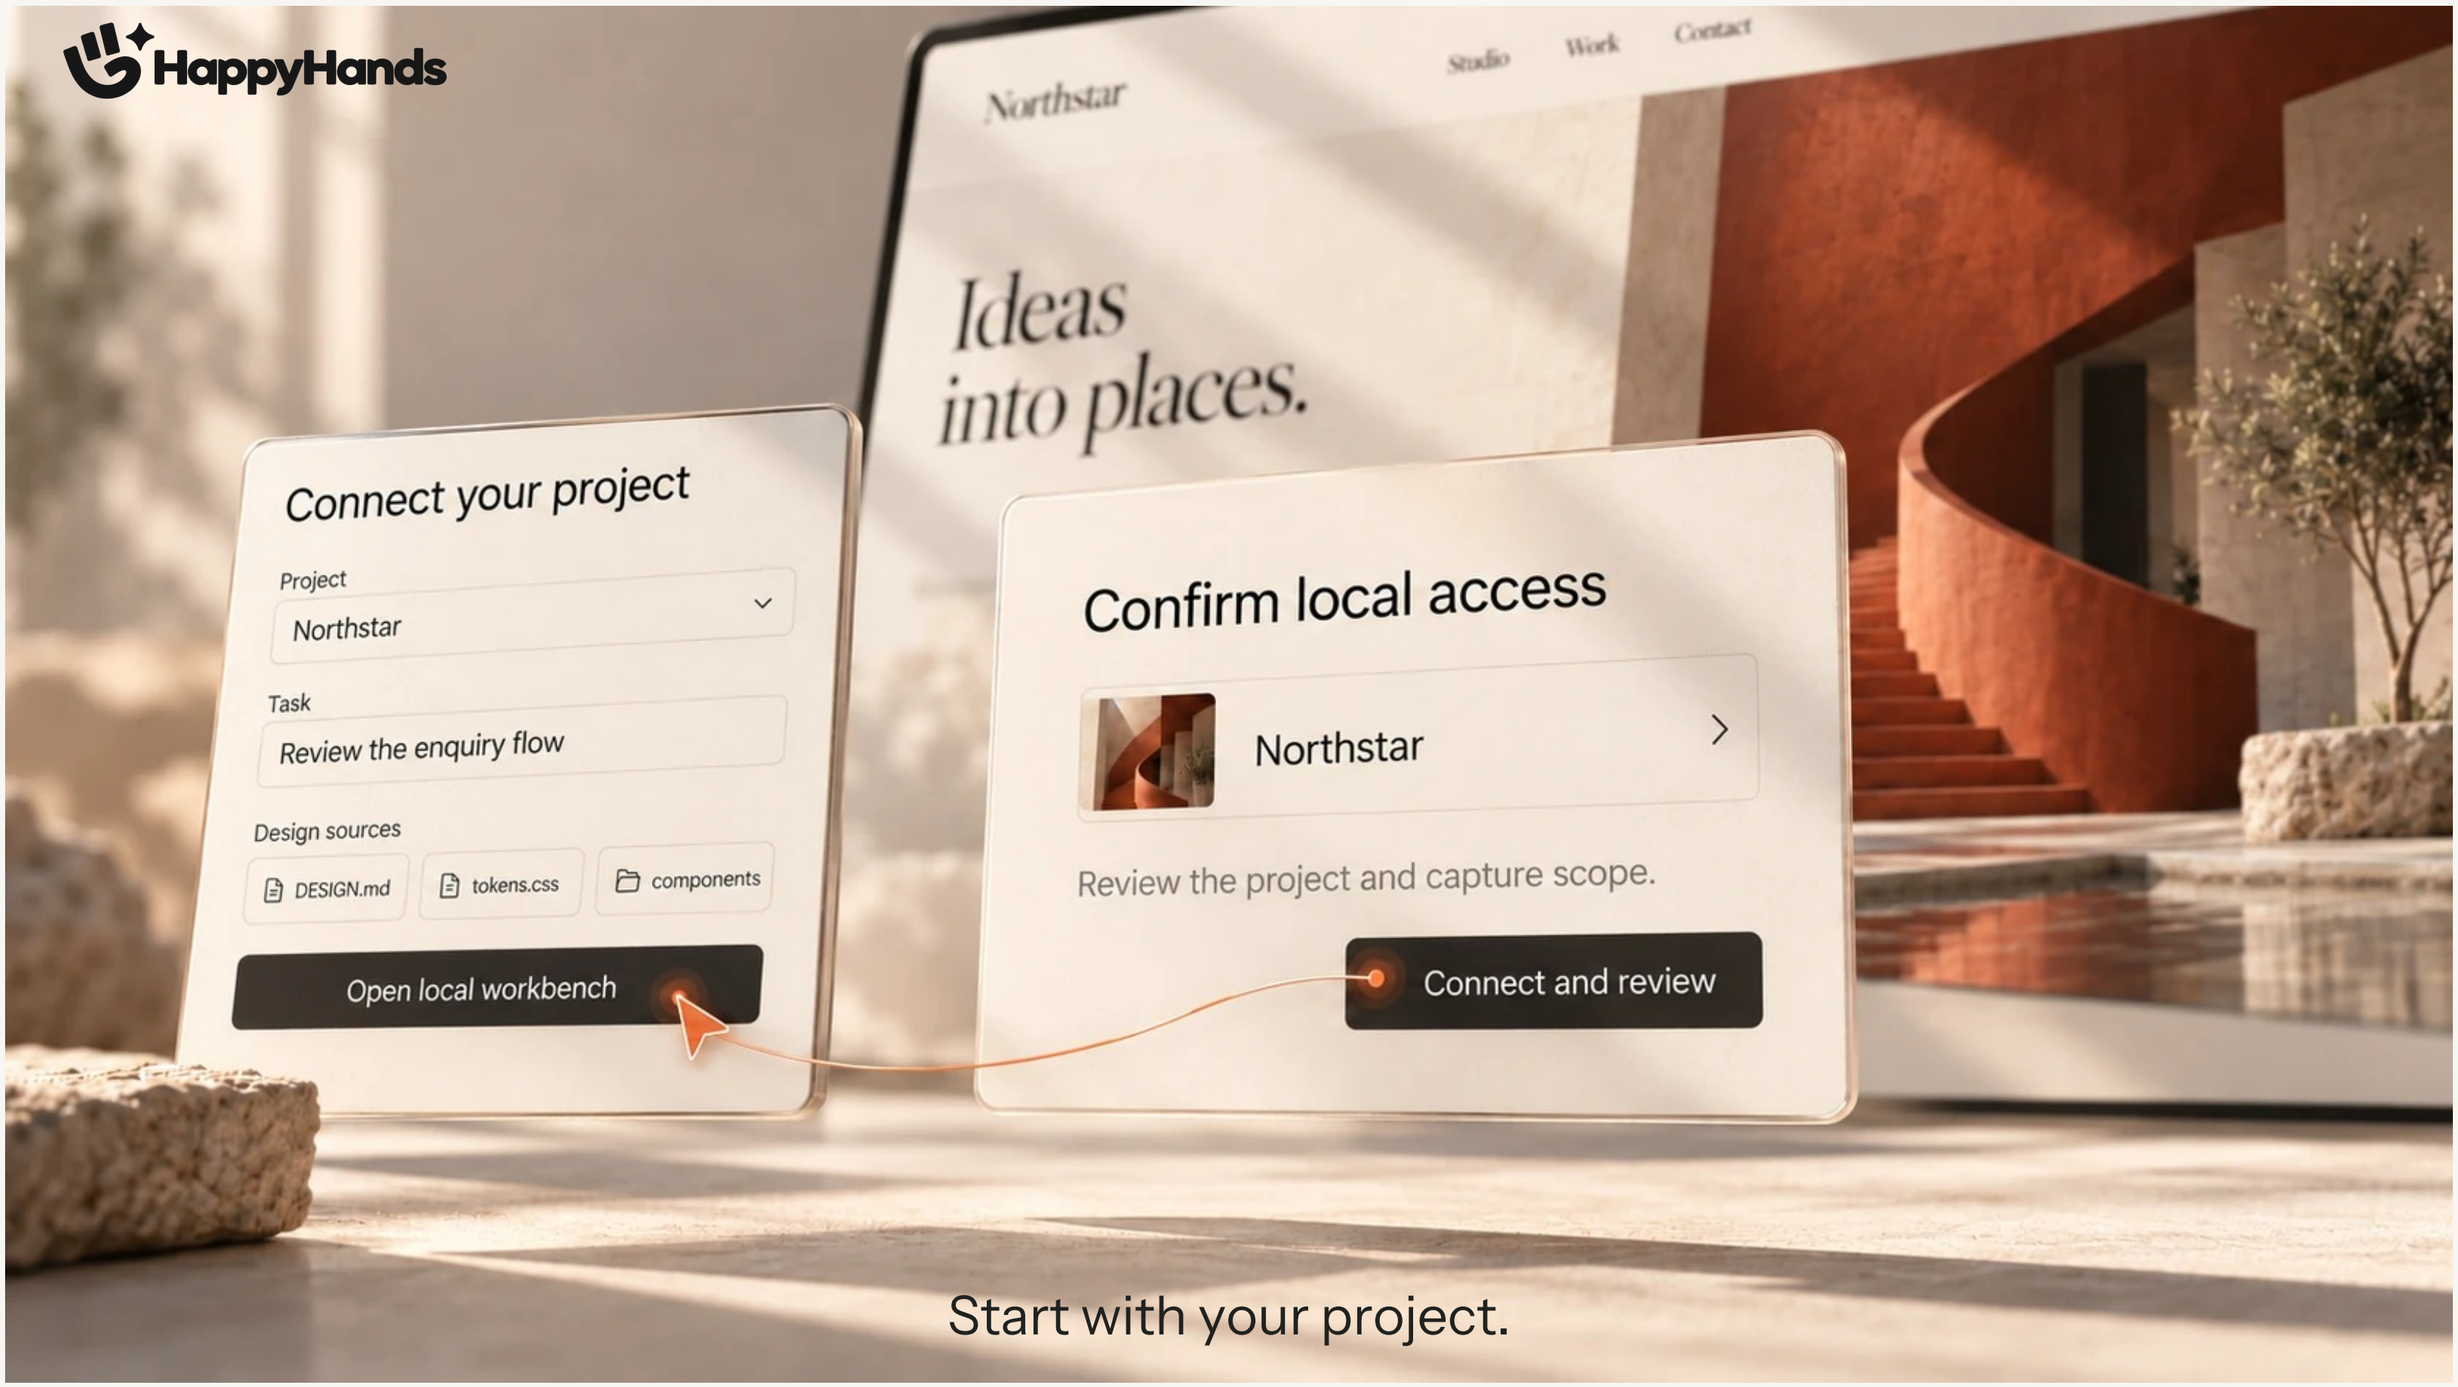

Camera & transition

A slow oblique push through the website plane; keep the architecture and type readable. The website edge becomes the boundary of the project connection pane.

Voiceover draft

Your product works. HappyHands helps you take the next step: a more considered experience.

Connect the real project

What happens

Carry the project, user task and design-source paths from the website to local confirmation.

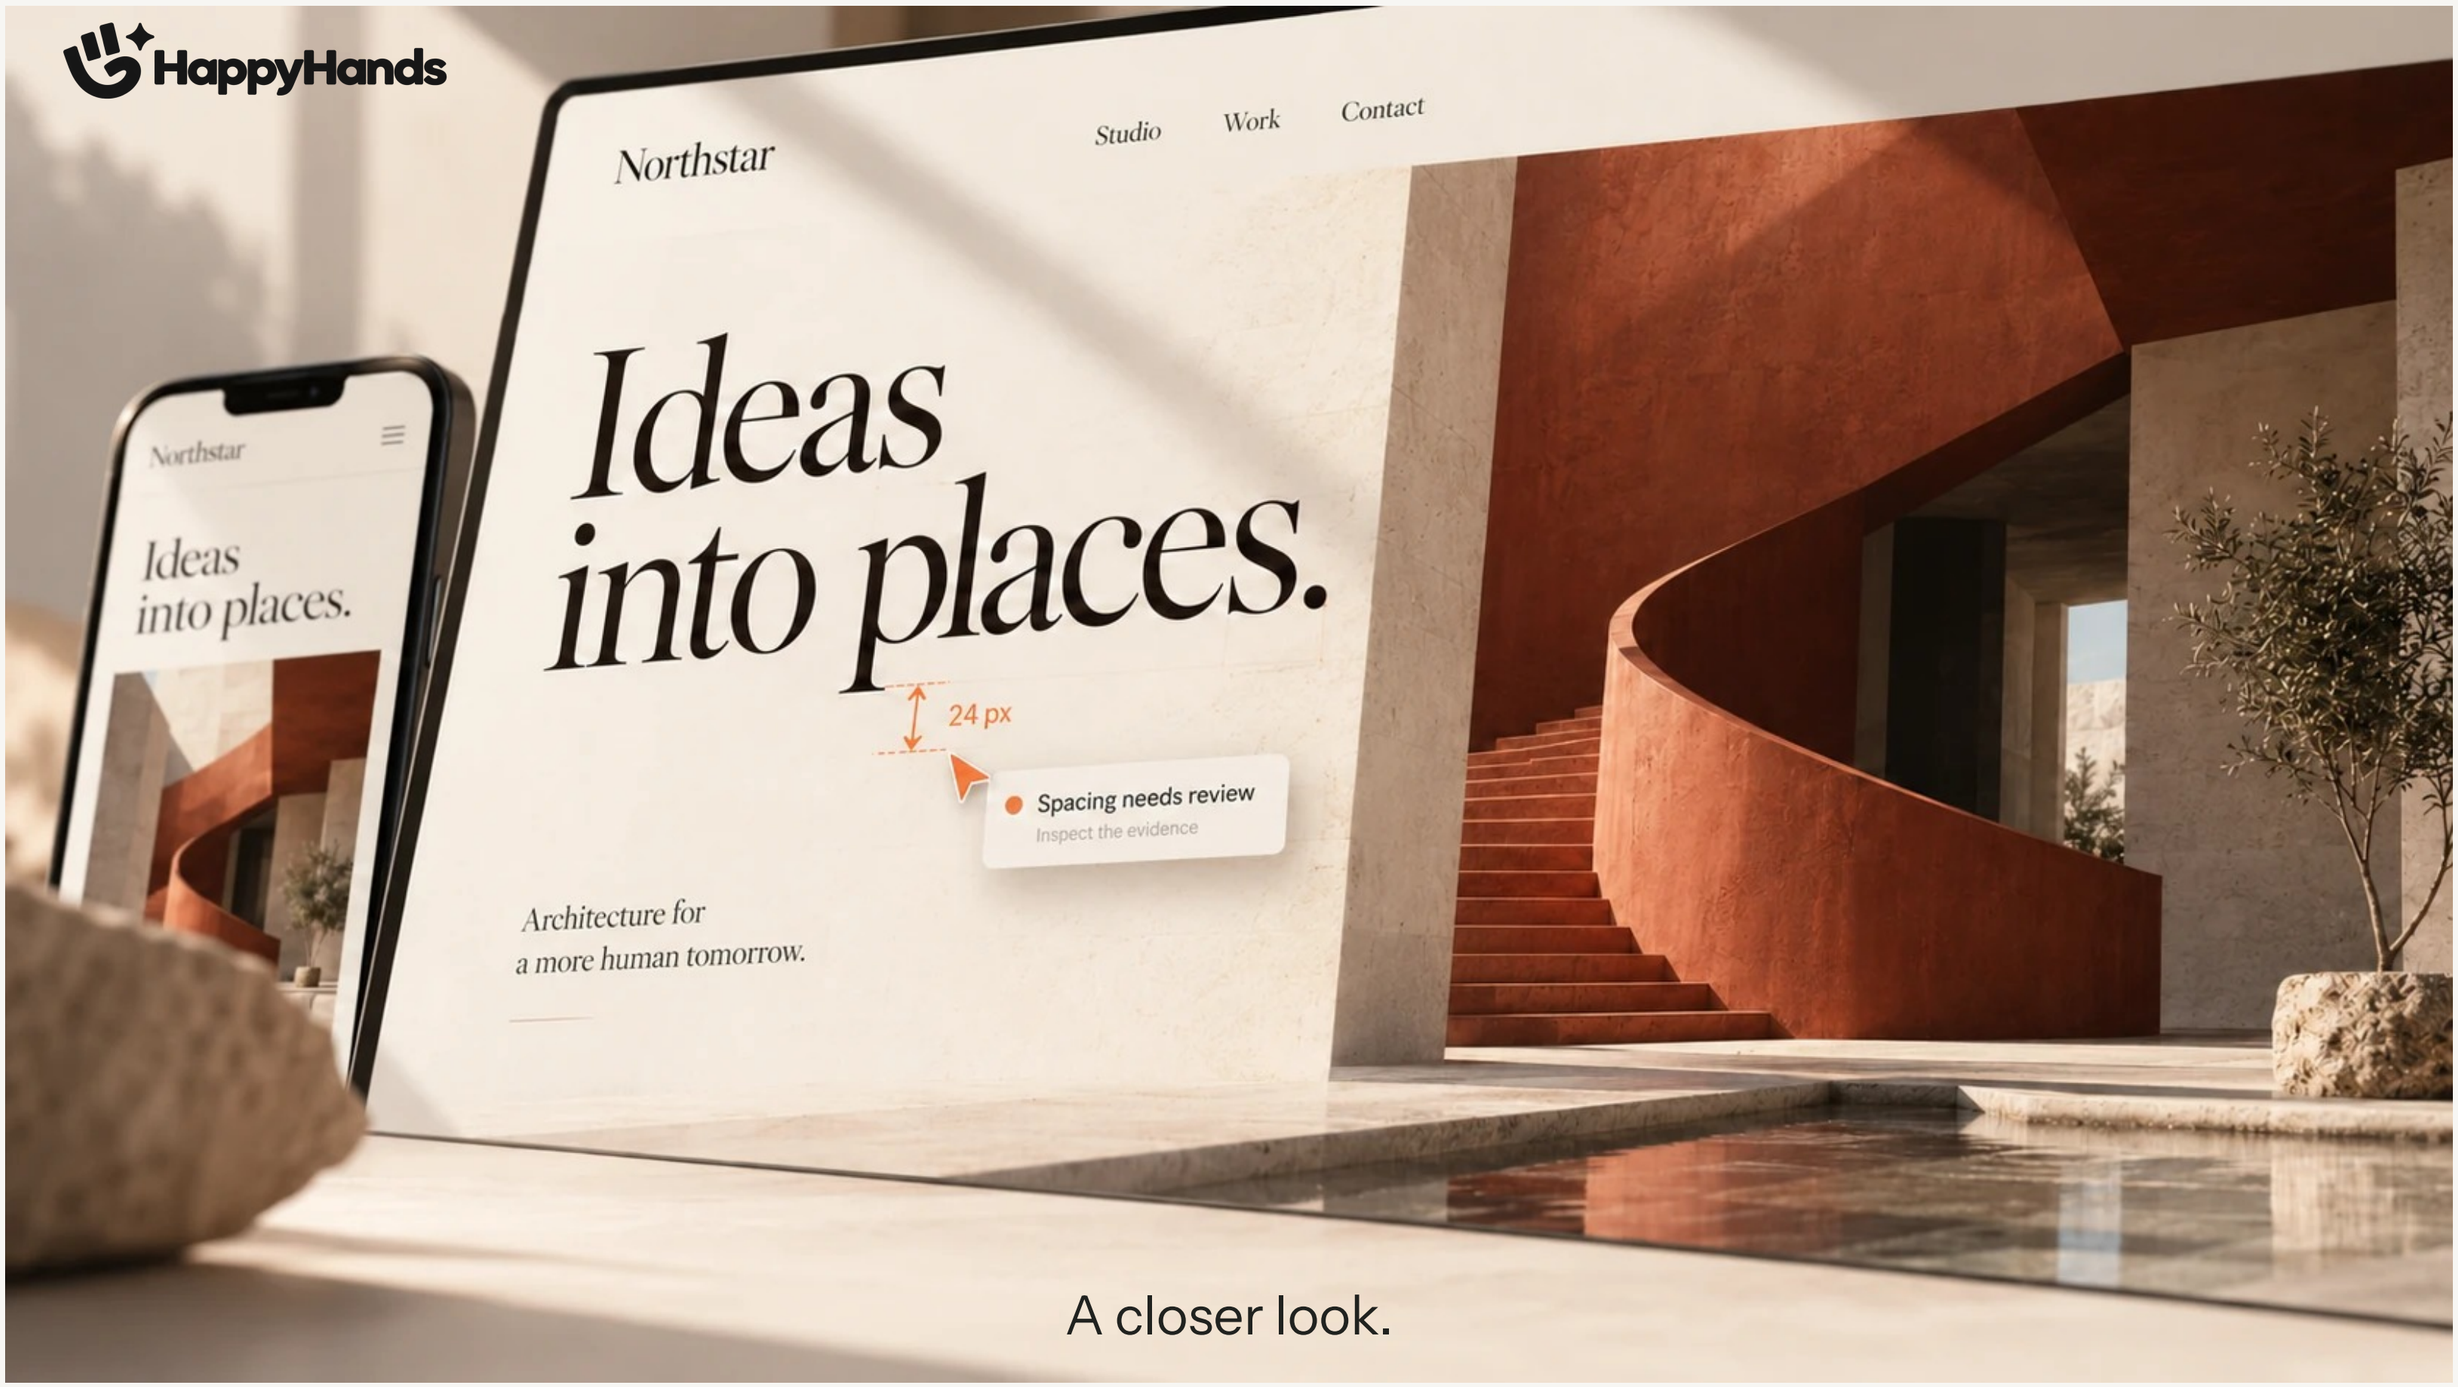

Camera & transition

Track the cursor between the two panes, then move into the local workbench. A confirmed local connection resolves into the first captured page.

Voiceover draft

Connect your repository and task. Bring your design sources, then confirm the project and capture scope locally.

Review the experience

A closer look.

What happens

Inspect normal desktop and phone captures, whole-page regions and explicitly planned interactions. Open the original image behind a candidate.

Camera & transition

Push into one spacing relationship, then reveal its attached review note. Hold the copper selection while the component separates from the page.

Voiceover draft

Review captured pages and planned interactions. Follow each candidate back to its evidence, and decide which problem is worth addressing.

Use the project’s design language

What happens

Connect existing DESIGN.md, style tokens and component sources to observed rules. Review selected constraints before approving a version.

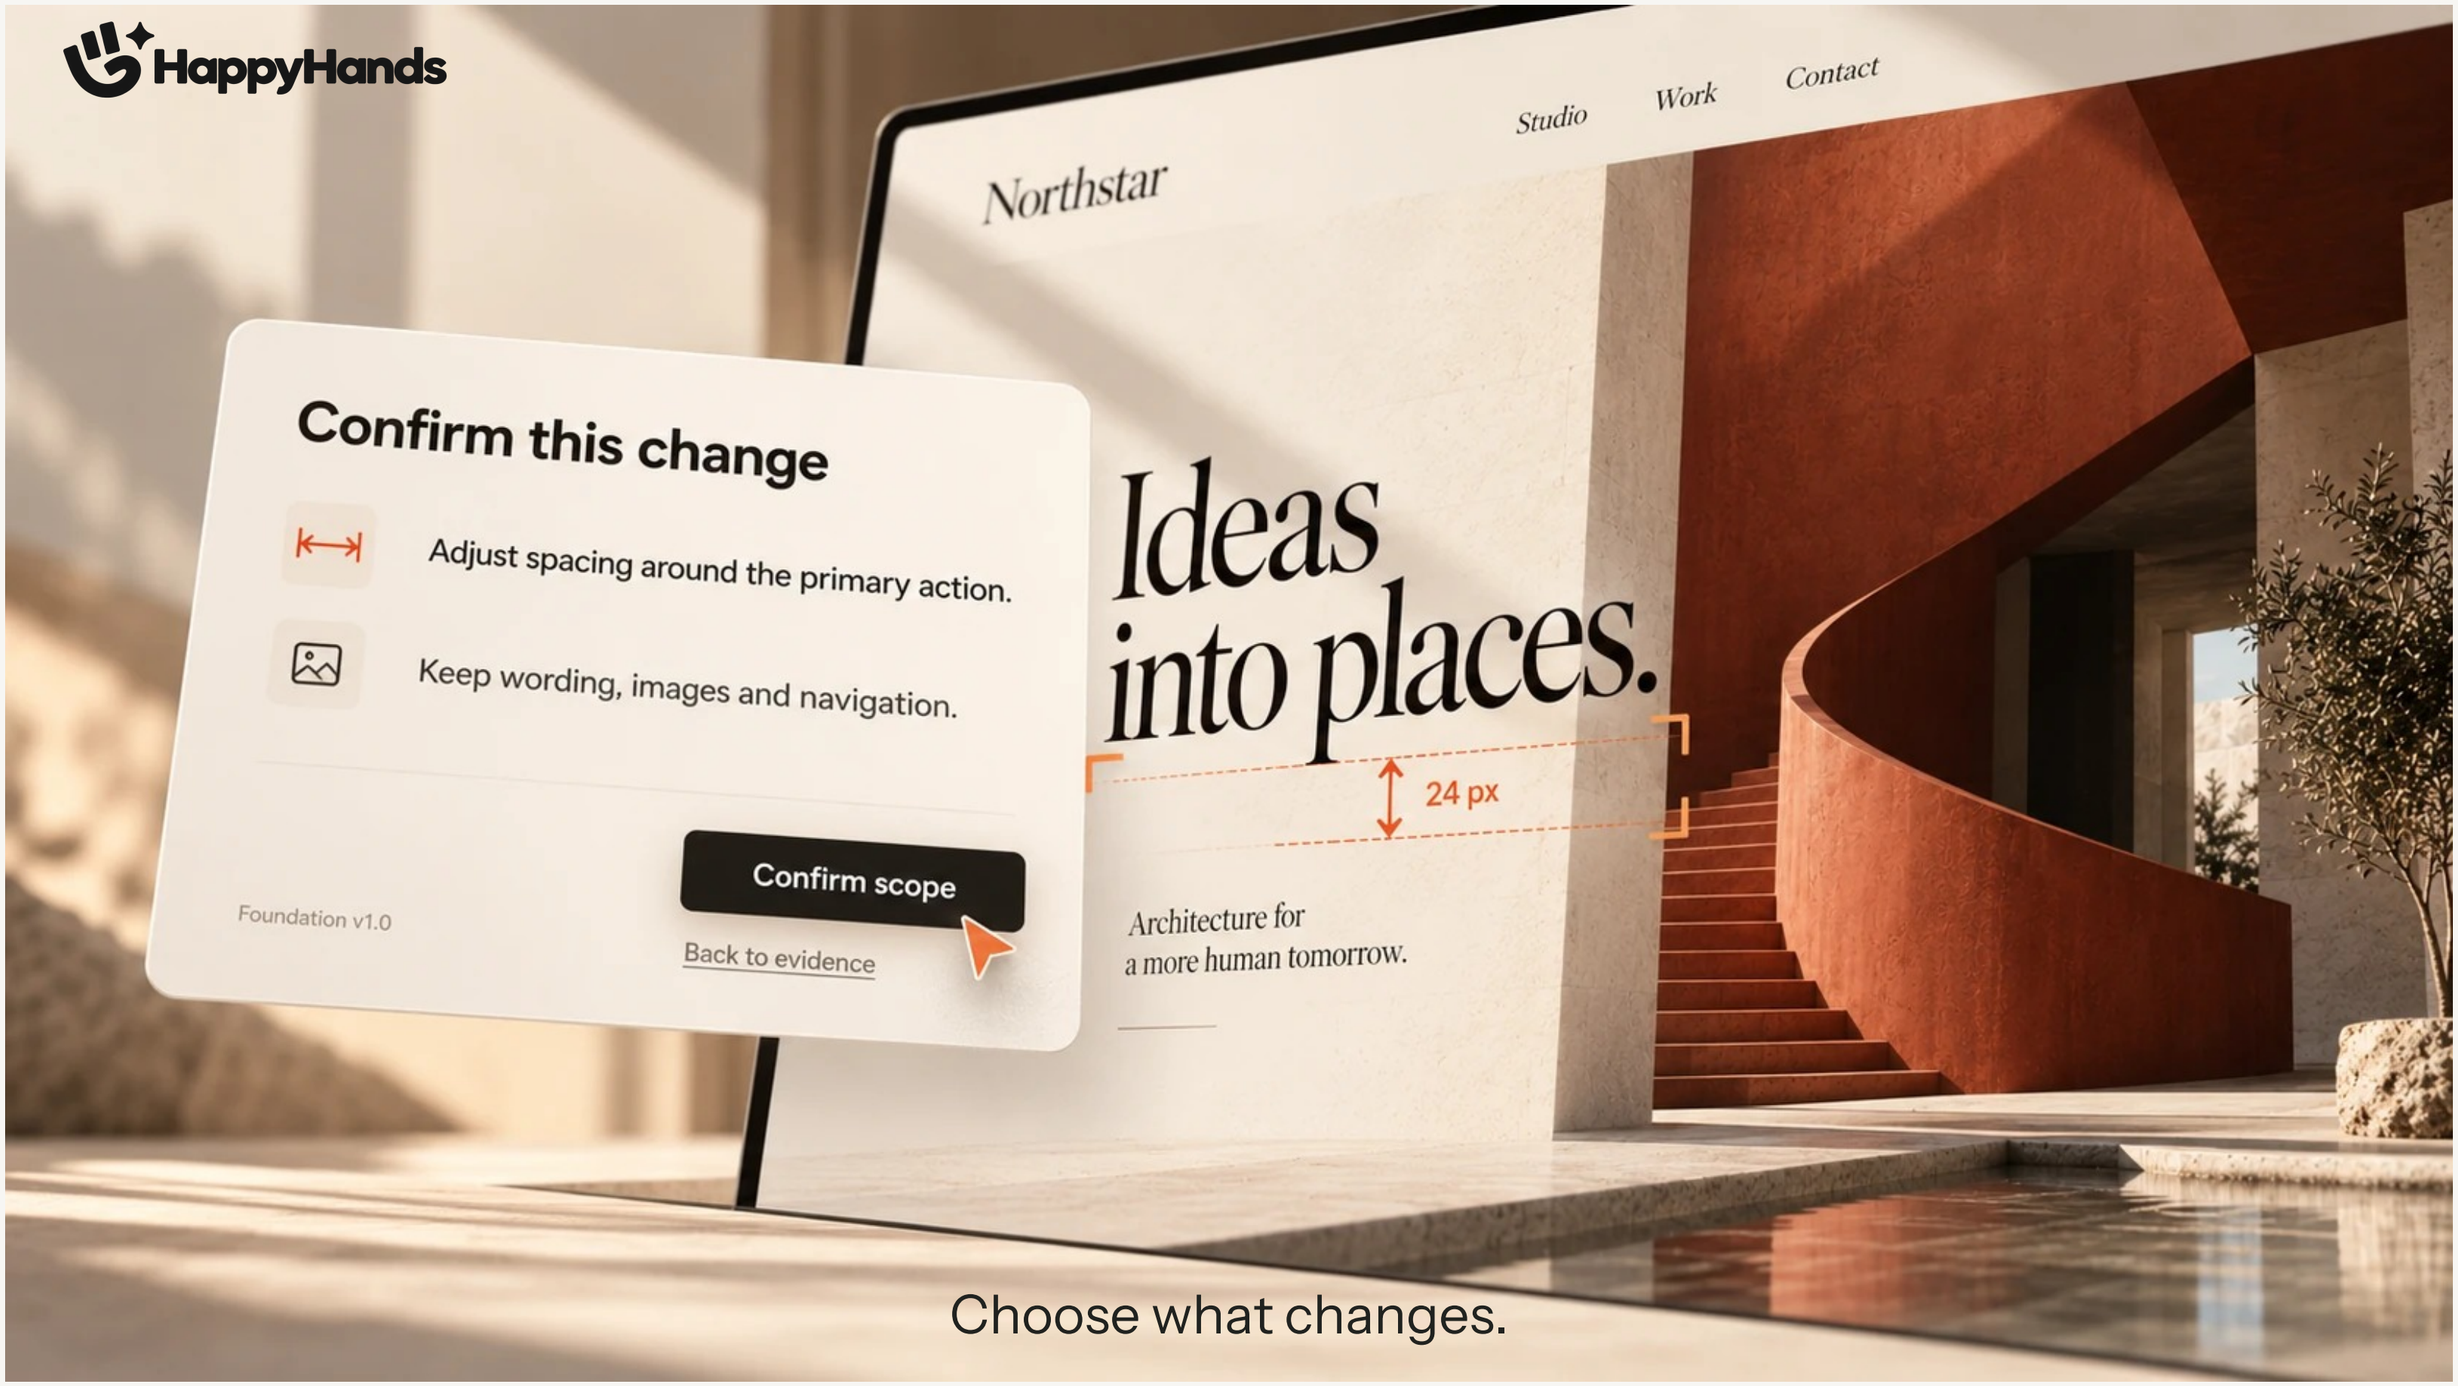

Camera & transition

Track from the component to its source, then settle on the explicit Foundation approval. The selected rule stays anchored as it becomes part of the confirmed brief.

Voiceover draft

Trace typography, spacing and components to their sources. Review the proposed rules and approve the design constraints you want the change to follow.

Confirm one bounded change

Choose what changes.

What happens

Confirm the specific spacing adjustment. Keep wording, imagery and navigation outside the change.

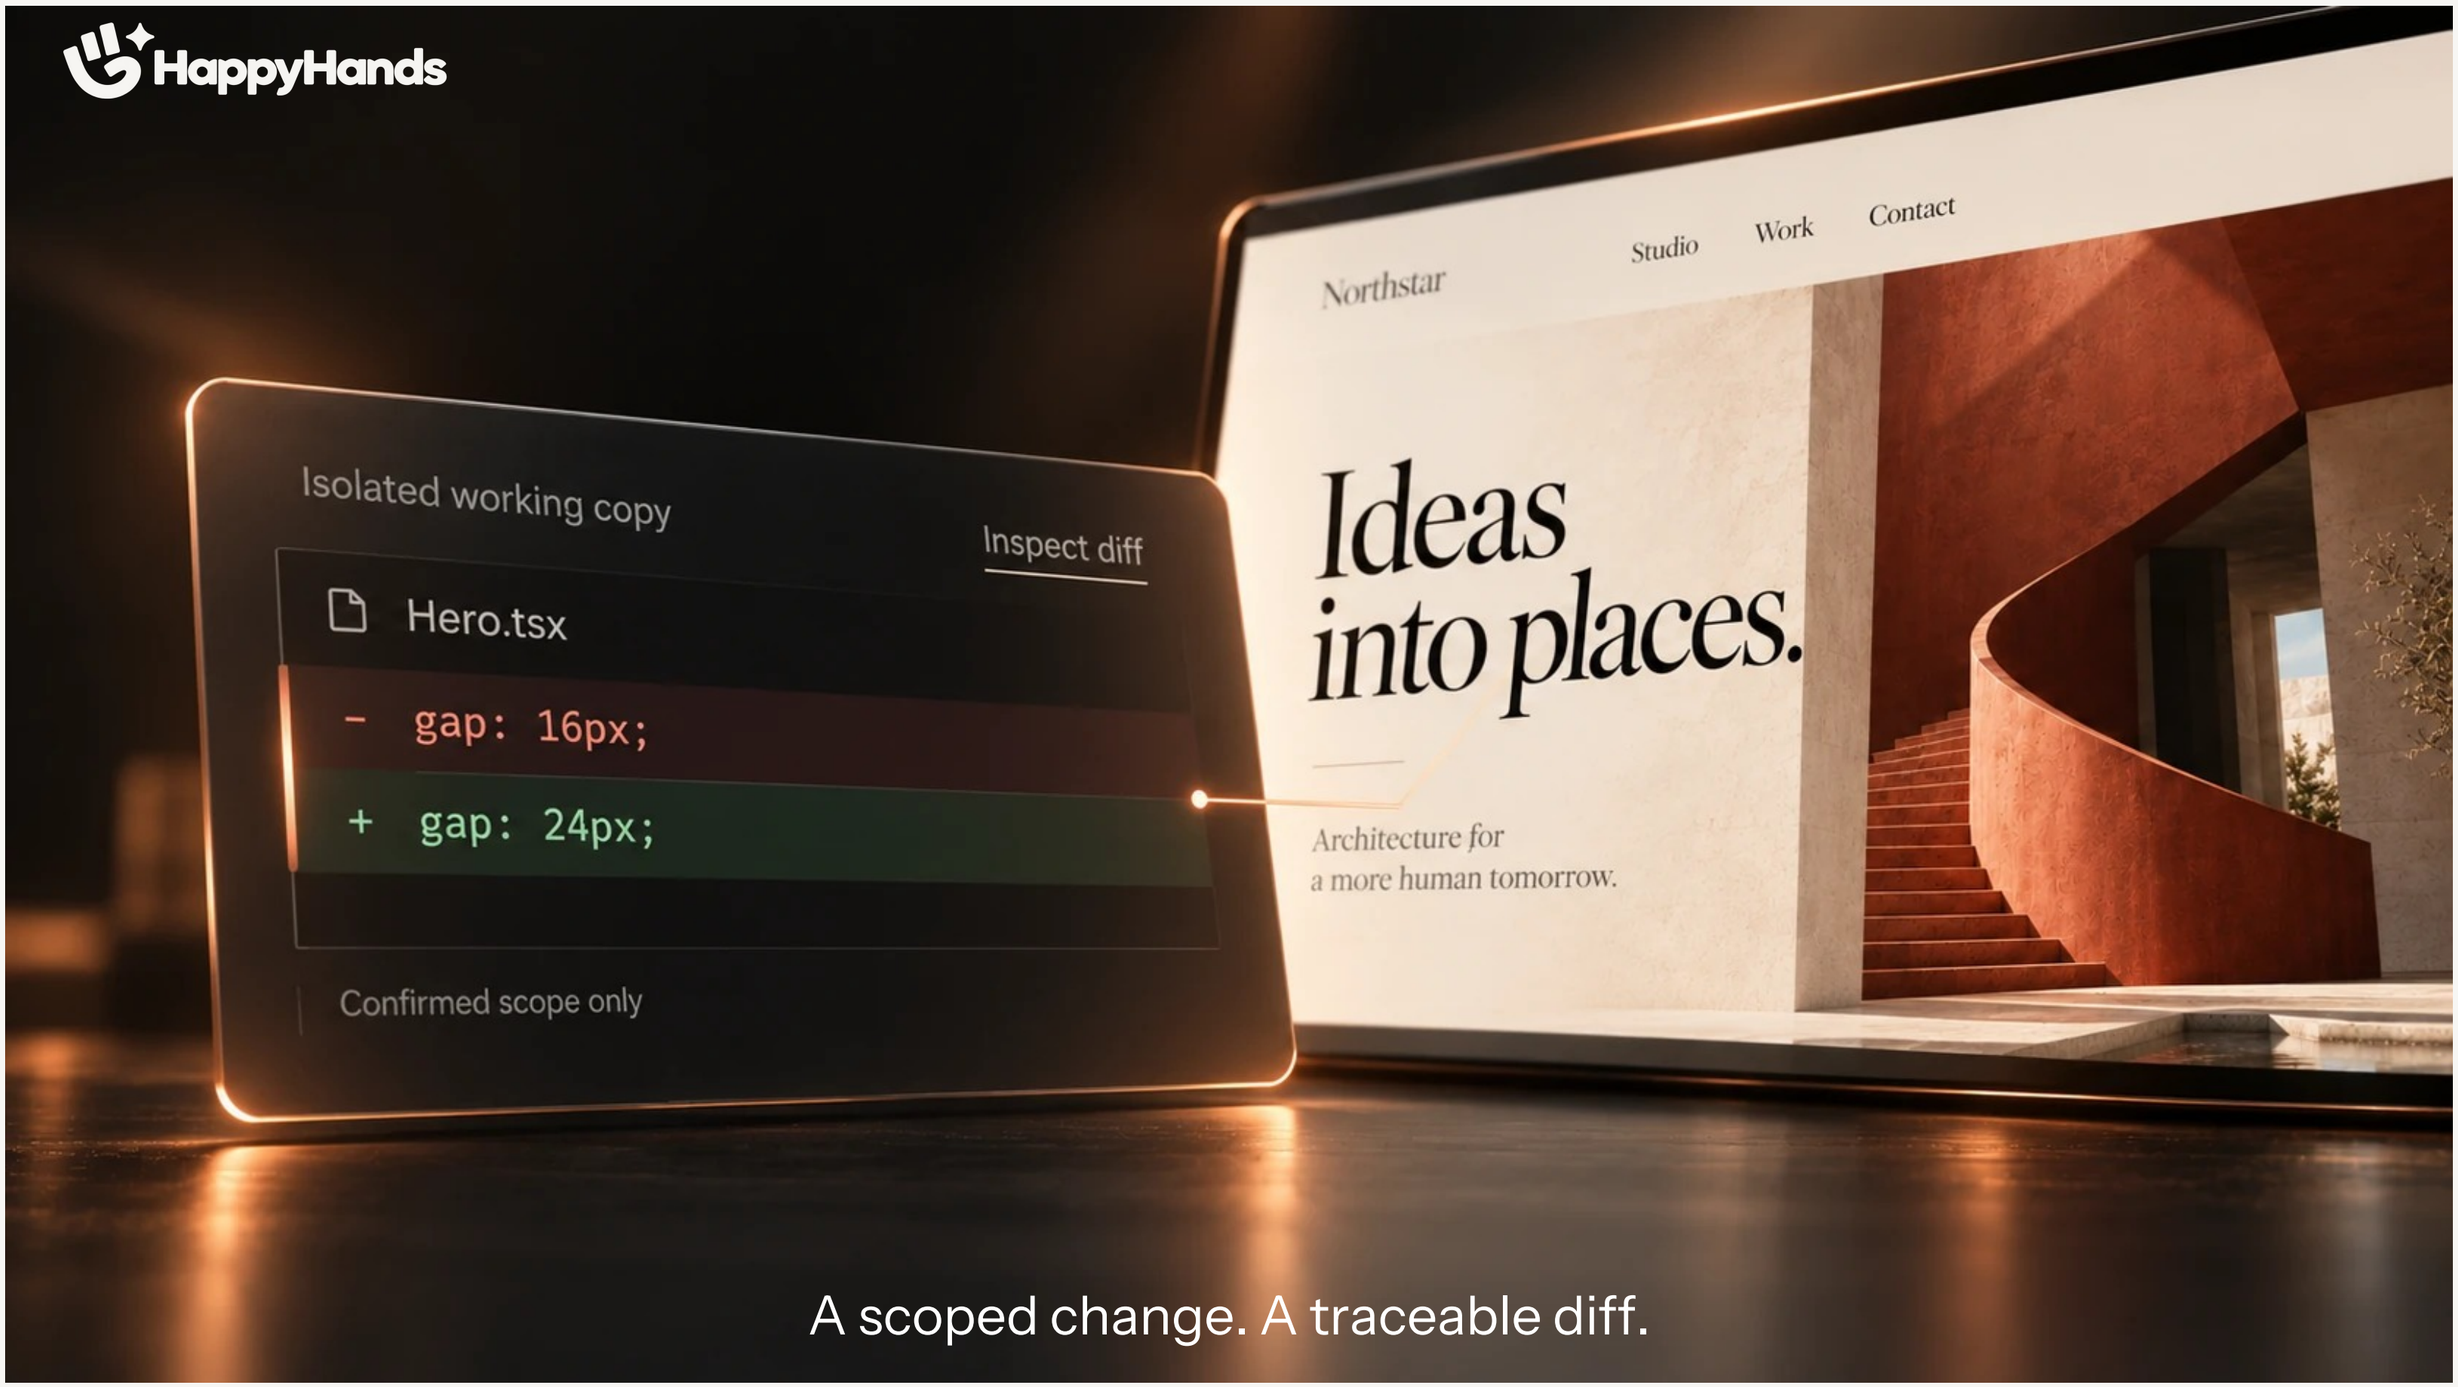

Camera & transition

Hold on the proposed boundary; let the cursor approach Confirm scope without skipping the decision. The selected spacing value match-cuts into the isolated code diff.

Voiceover draft

Choose a supported issue and confirm its boundaries. Keep the content and navigation that already work, and approve only the intended adjustment.

Turn the decision into code

What happens

Pass the confirmed brief to the configured coding agent. Inspect the isolated working-copy diff and managed preview.

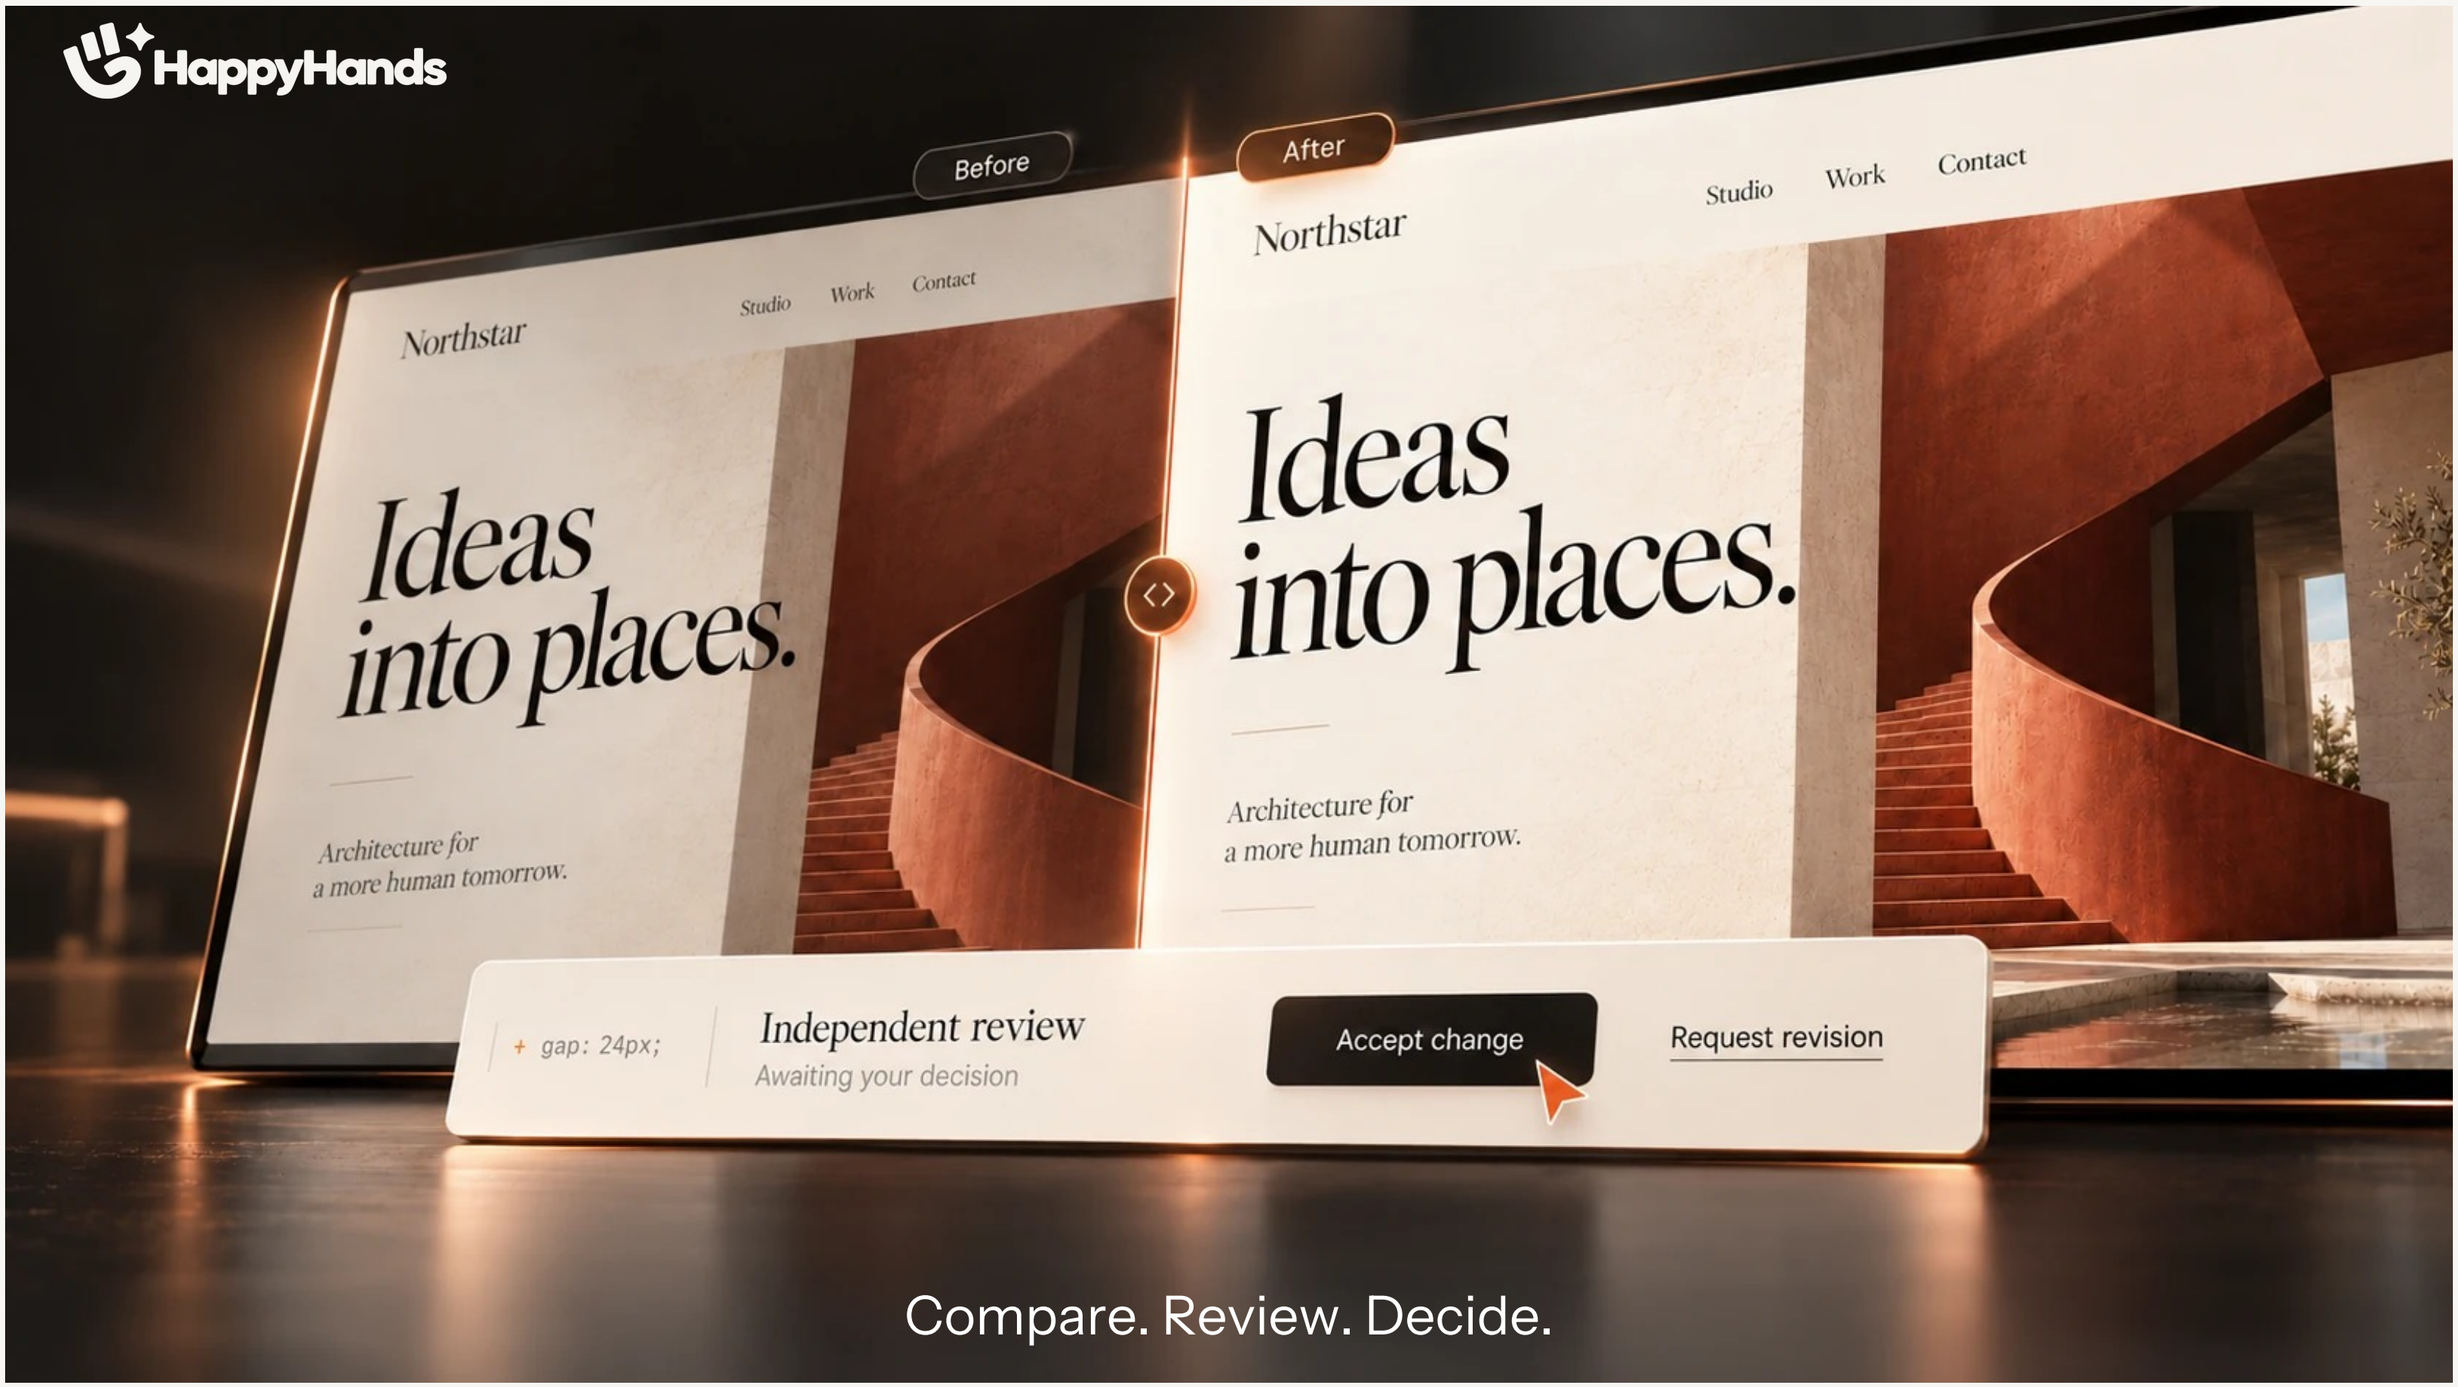

Camera & transition

Follow the highlighted source line into the rendered component. The copper diff marker becomes the before/after comparison seam.

Voiceover draft

The coding agent works in an isolated copy. Inspect the relevant code changes and preview the result against the approved scope.

Compare, review and decide

What happens

Compare the same planned state and viewport. Inspect independent review and supporting evidence before a human decision.

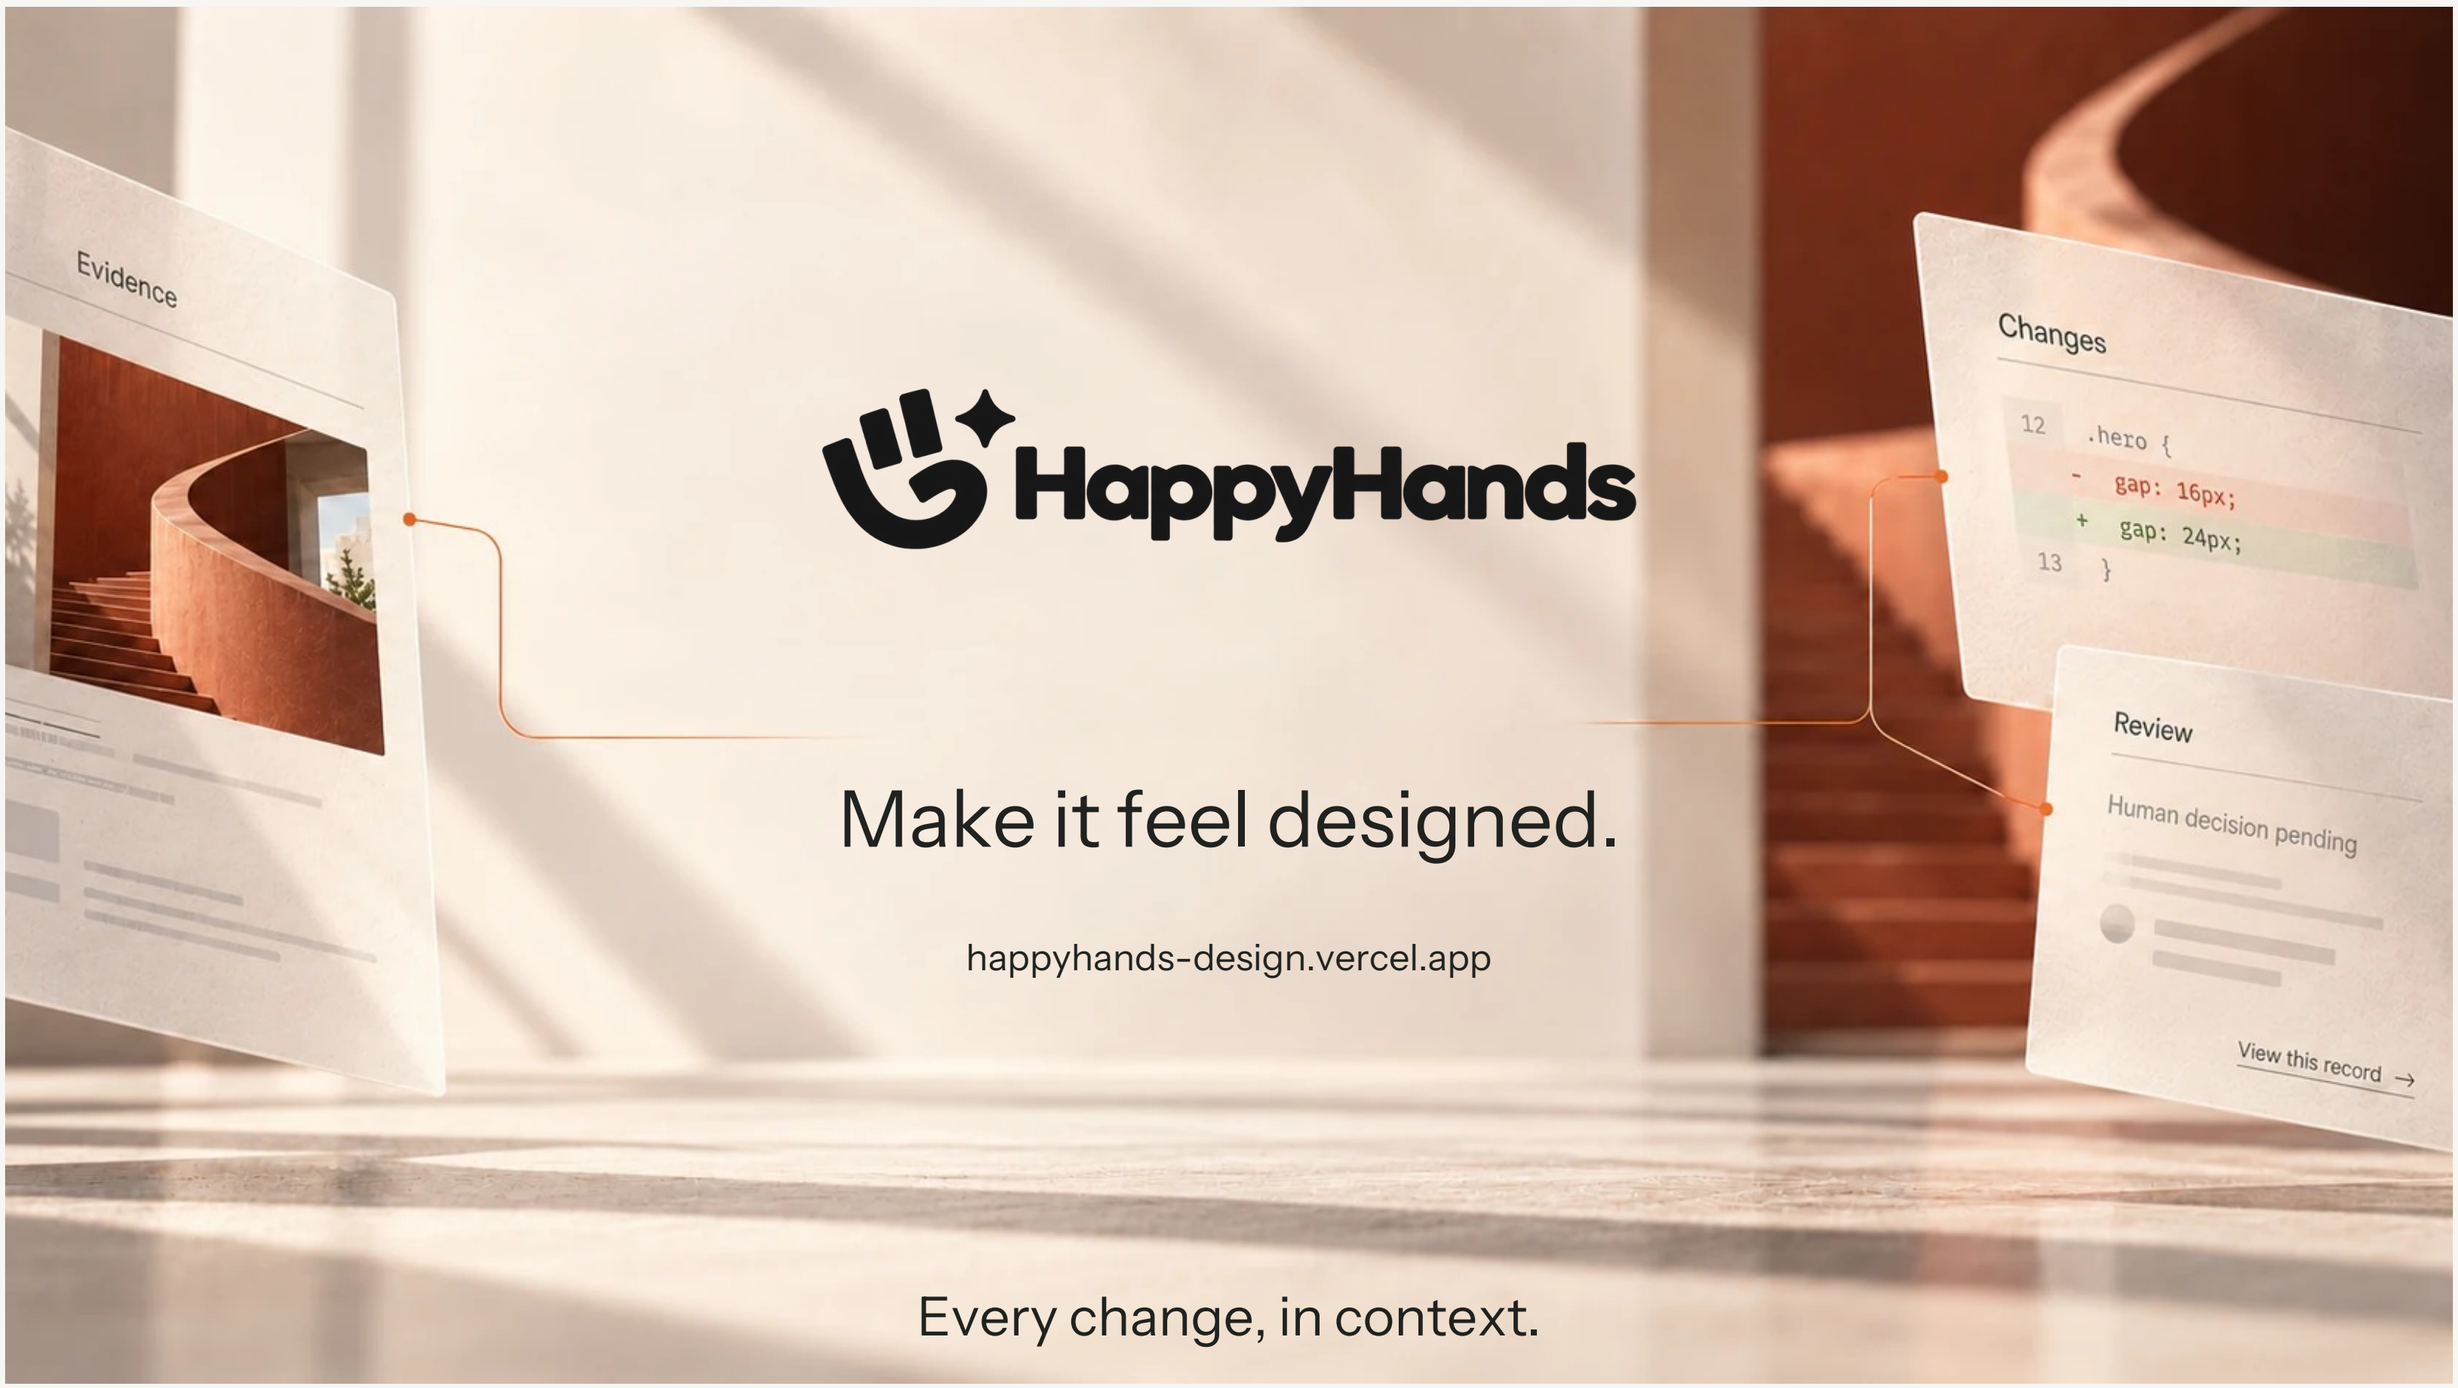

Camera & transition

Wipe across a fixed comparison, then pull back to the decision strip. The comparison and review notes settle into the same durable run.

Voiceover draft

Compare matching page states and viewports. Read the independent review and its limitations, then decide whether to accept the change or request revision.

Return to the same record

What happens

Keep source, page evidence, code changes and review in the same run. Return through the website’s saved handoff link.

Camera & transition

Pull back from the record; the official hand-and-wordmark logo settles into the clear center. Hold the brand and the real website address for the final three seconds.

Voiceover draft

Keep the context together. Return to the same record, and make your product feel designed.

Brand, type and capability boundaries

Official identity

Use the original HappyHands hand-and-wordmark artwork. The generated scene plates contain no substituted HappyHands wordmark. Logo overlays in the PDF and web viewer use the repository asset.

Typeface roles

Instrument Sans Regular and Bold: exact loaded files for HappyHands film captions, controls and the review page. Instrument Serif Regular: display only inside the fictional Northstar project. Both use included OFL notices. Raster lettering is concept art; final production must typeset product UI labels using these specified files.

Truthful demonstration

The scene imagery, code and pixel labels are illustrative. Before showing executed or verified outcomes in the finished film, replace them with a real scoped sample and its Harness evidence. Model candidates require confirmation; Foundation approval and human acceptance are separate decisions.

Current execution boundary

The public website carries project/task/source paths into the local workbench; it does not execute coding agents in the cloud. Codex CLI and Claude Code CLI are registered adapters. Captures cover declared states and viewports, not every unseen route.

Approval boundary

This deliverable is a static 80-second storyboard and narration draft. No video, sound, target-project edit, acceptance or production deployment is included.
